

Organizations that need reliable, secure, and flexible communications between headquarter and remote operations turn to satellite communications. Why? Because no other networks can connect ALL of your offices, wherever the location and whatever your requirements.

UltiSat has many years of experience delivering Internet access, voice, video, and other data across networks, however remote or extreme the sites are. From maritime and energy installations in the Nordic region to military and commercial operations in severe and harsh locations, we provide a tailored mix of mobile satellite and VSAT systems to ensure efficient wide-area networking. In addition, you can provide your remote workers with the critical communications to families and friends that today's employees demand.

As exploration opportunities get more difficult and energy options more diverse, our satellite communication solutions will keep you connected wherever your activities are and will ensure 24/7 access to the modern applications and personnel that you rely on in the field.
